ACKNOWLEDGEMENT

This space is dedicated to acknowledge all those who have helped in bringing this project to fruition. We are greatly indebted to our guide Prof. A. S. Phalle and MP-I Coordinator Prof.P.V.Nalawade for his unstinted support and valuable suggestions. We are grateful to them not only for the guidance, but also for their unending patience and keeping our spirits high throughout. We express our sincere thanks to our beloved Head of the Department, Dr. R. B. Patil and Principal, Dr. D.N. Mane for being source of inspiration and providing us the opportunity to work on this project. We extend heartfelt thanks to all the teaching and non-teaching staff of the department of computer science and system and network support of TKIET for their assistance and cooperation Finally, we would like to thank our parents and friends for their moral support and encouragement throughout our academics

ABSTRACT

Life+Link System is a web-based healthcare and organ donation management platform developed using Python, Streamlit, and SQLite database. The main objective of the system is to simplify and digitize organ donation management, hospital communication, emergency organ request handling, and organ inventory management through a centralized digital platform.

In traditional healthcare systems, donor records, emergency communication, and organ request management are mostly maintained manually. This process consumes more time, increases paperwork, and creates difficulties during emergency situations. The Life + Link System overcomes these limitations by providing an organized and automated healthcare management solution.

The system contains separate modules for Users, Hospitals, Organ Banks, and Administrators. Users can register as organ donors and manage their profiles. Hospitals can send organ requests, manage patient details, and handle emergency cases. Organ banks can maintain donor inventory and manage organ availability, while administrators can monitor the complete system using analytics dashboards and reports.

The project is developed using Streamlit framework for frontend interface development and SQLite database for backend storage. The application also includes blood group compatibility matching, certificate generation, dashboard analytics, sound notifications, and secure authentication functionality.

The Life + Link System helps in reducing manual paperwork, improving communication between hospitals and organ banks, and providing faster emergency response management. The project demonstrates the practical implementation of Python-based healthcare automation systems using modern web technologies.

INDEX

Page No

Chapter 1. Introduction

1.1 Introduction
1.2 Motivation
1.3 Purpose
1.4 Objectives

Chapter 2. Literature Survey

2.1 Existing System
    2.1.1 Elaborate on Existing System Applications / Examples
    2.1.2 Limitations or Challenges in Existing System
2.2 Problem Statement
2.3 Feasibility Study

Chapter 3. Project Scope and Requirement Analysis

3.1 Requirement Gathering and Analysis
3.2 Software Requirements
3.3 Hardware Requirements
3.4 Function requirements (user defined function and System Function)
3.5 Non Function requirements

Chapter 4. Project Module Design Details

4.1 Software Requirement Specification (SRS)
4.2 System Architecture
4.3 System Modeling and Design
4.4 Data Structures used

Chapter 5. Implementation

5.1 Algorithms
5.2 Flowcharts
5.3 Output Screenshots

Chapter 6: Test Specification

6.1 Input validation

Chapter 7. Conclusion
